

EARTHQUAKE

## ***WHAT'S AN EARTHQUAKE?***

- Earthquakes are natural vibrations caused by sudden movements in the Earth's crust, the Earth's thin outer layer.
- Earthquakes are a type of natural hazard.

# THE TURKEY - SYRIA EARTHQUAKE

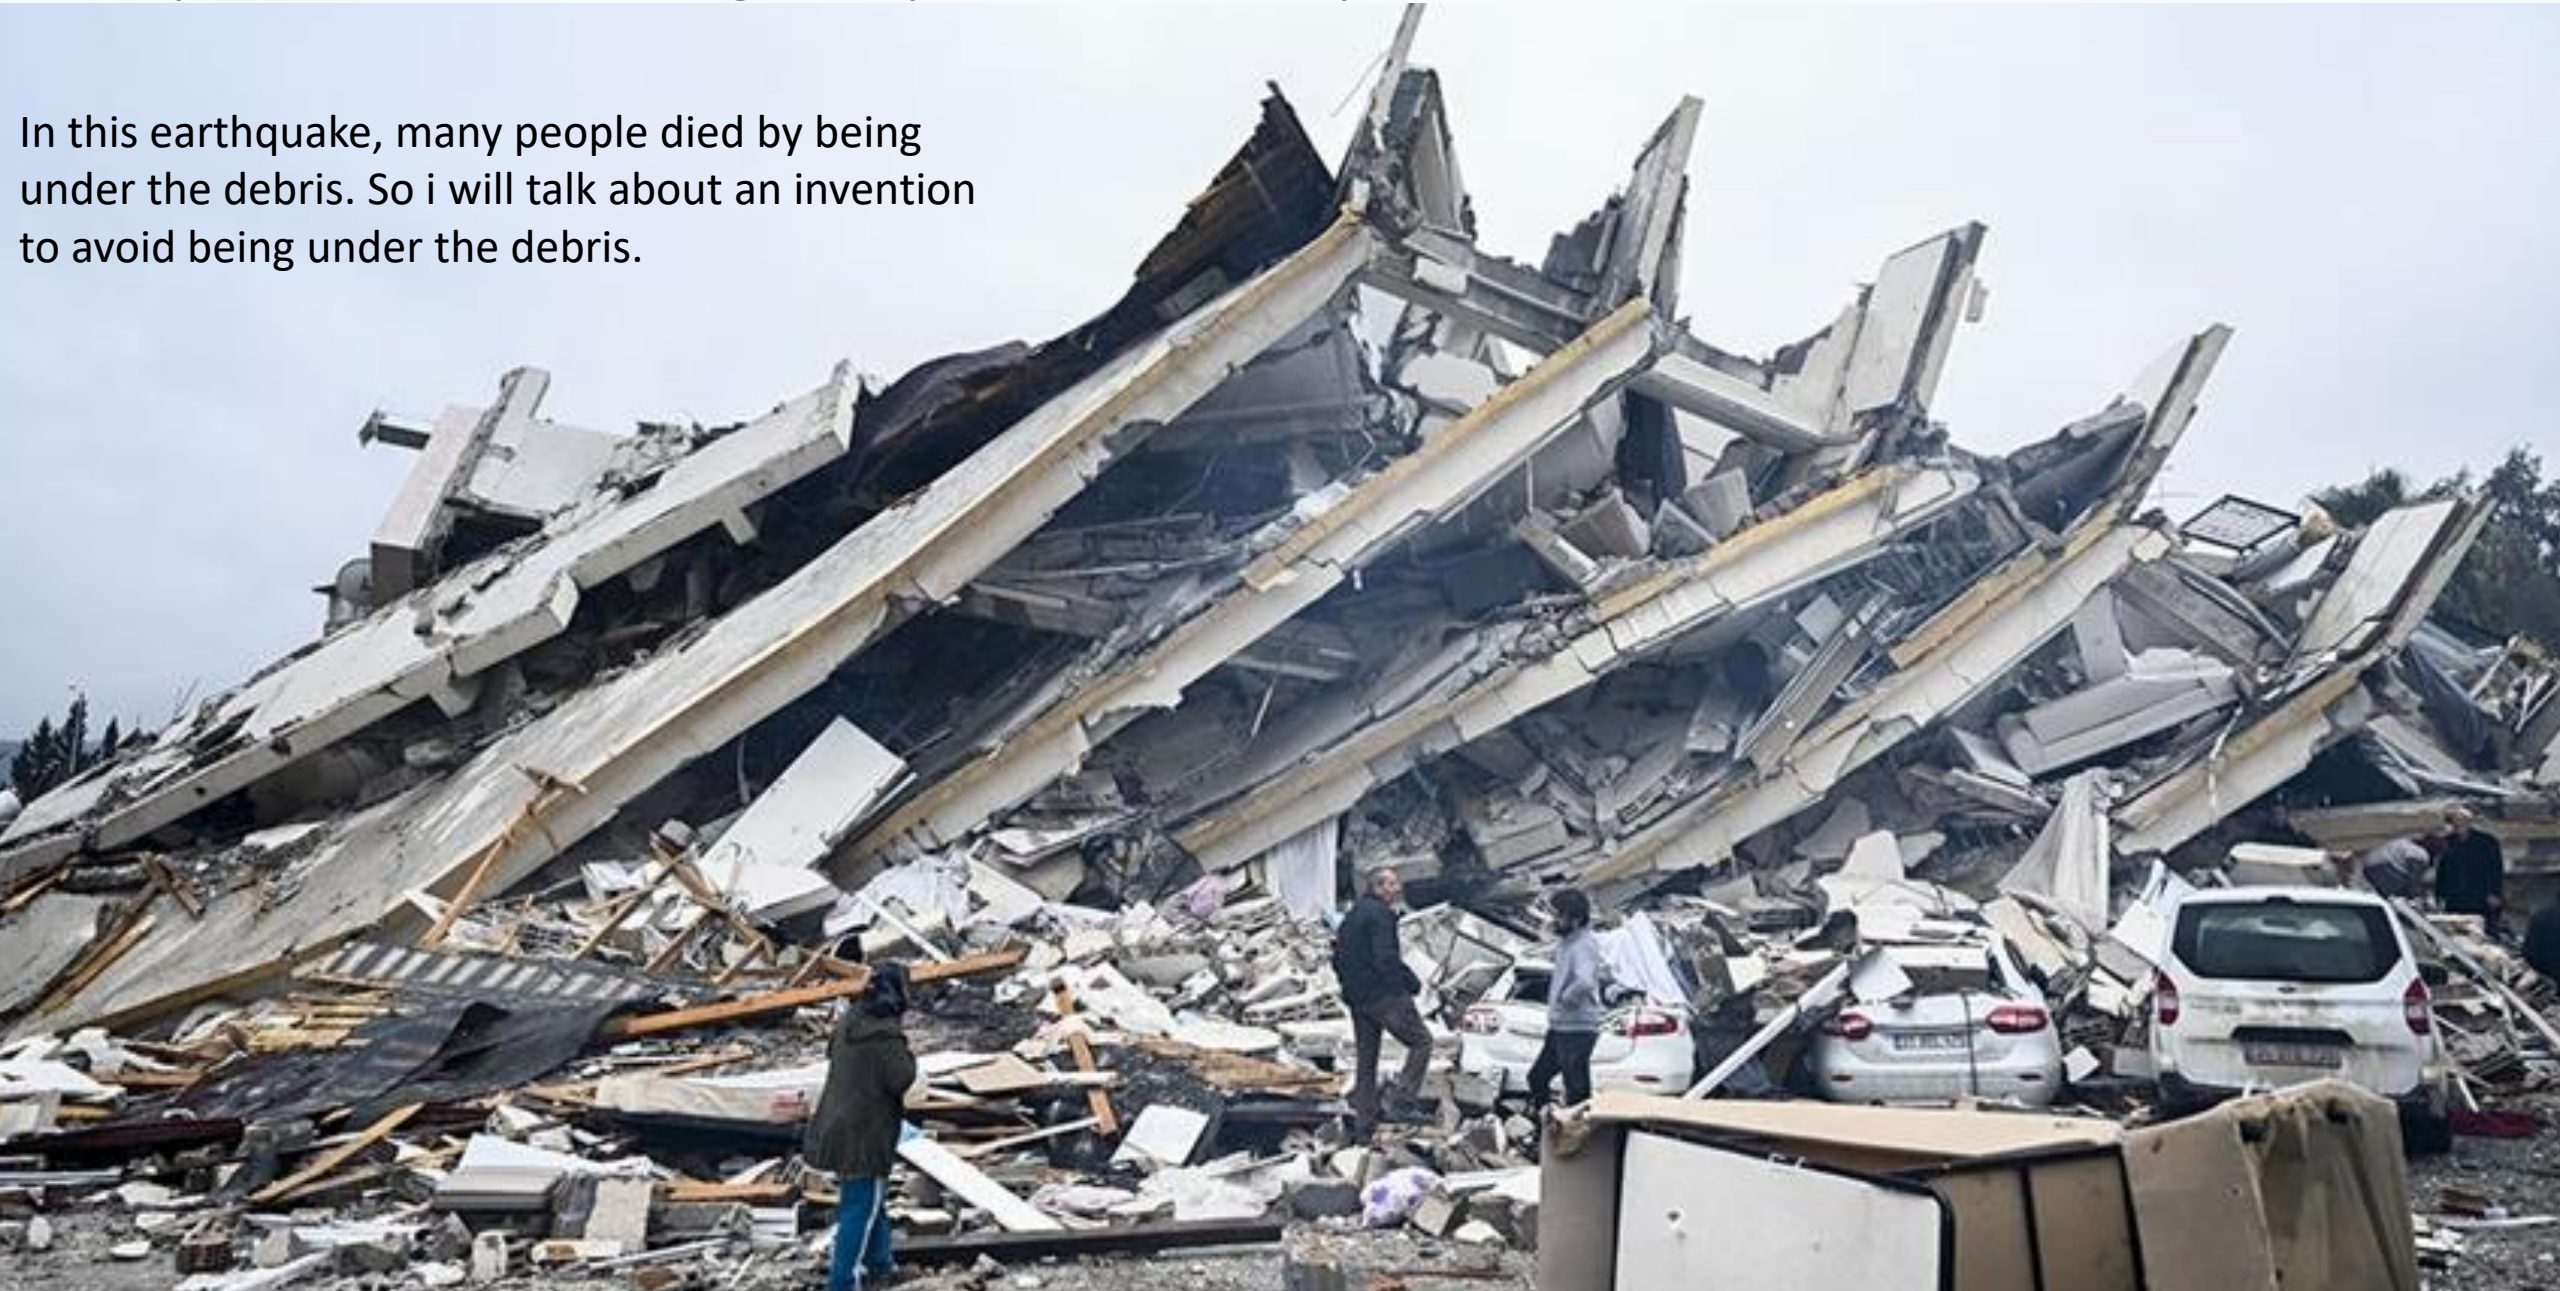

Turkey's earthquake had a magnitude of 7.8 and now has a death toll of more than 47 thousand. The damage to turkey/ Syria costs 84 billion. This made five million people homeless. It was 24 kilometers long.

Recently, there was a devastating earthquake in our country.

In this earthquake, many people died by being under the debris. So i will talk about an invention to avoid being under the debris.

Actually, this invention is something that exists. I want to add something to this invention.

- There will be a mechanism in this cabin that will open the doors when an earthquake occurs
- Also, when we press the button inside, the doors should close
- There should also be a mechanism that shows our food stock
- Various signal senders to call for help must exist
